Milestone 1 Considerations
Reviewed during Friday discussion sections October 17th

What dimensions might we need?

(When?) Date_dim?

(Who?) Account and account_owner dim?

What hierarchy is mentioned for database account?

How can we determine whether an account is individual use or an application account?

Where can we find the account_owner for application accounts (non-netid)?

How will you handle the requirement around identifying (if and when) an account owner changes (unit, department, or employment status)?

(What?) Database, Datamart, Role, Table, access type?

Information about what an account has access to could be bundled in one large dimension, or across a few smaller dimensions. The dimension(s) would contain the possible combinations of access which could be linked to an account.

What is the hierarchy for this area of dimensionality?

What might drive a decision to create one big dimension, versus splitting into smaller dimensions?

Fact tables needed to meet requirements?

What are the two areas you are being asked to measure?

What type of fact table may be appropriate to meet these requirements?

What would be the appropriate grain to meet these requirements?

Thoughts on data model naming?

Thoughts on source-to-target mapping?

Thoughts on data dictionary?
